Как это работает под капотом:

Скрипт берет 4 статистических значения детали. Ищет до двух значений с наибольшим отклонением от нуля (самые большие отклонения от нуля). Если значение попадает под условие (например, > 30 или < -20), он выводит соответствующий тег. Почему двух? Чтобы дизайн интерфейса не ломался

(Если у детали все значения около нуля, например *Cheap V-Brakes*, она идет без тегов, как базовая деталь).

1. FRAMES (Рамы)

- **Heavy Steel MTB** → [ Indestructible] [ Heavyweight]
- **Alu City Hybrid** → [ Fast Rolling] [ Ergonomic]
